

Planning Package

GIT414-GIT515

Project Brief

The site exists so people can watch lifts, learn who the trainer is, and request a private session. It is not an app, a checkout flow, or a member portal. The primary audience is beginners through advanced trainees who want online or in-person coaching. They are not here to submit a health history. Primary user tasks:

- Watch tutorials.
- Read the trainer's background.
- Request a session.

Constraints stay inside HTML and CSS. There is no account login, live calendar, payment processing, or JavaScript-dependent filtering. The request form collects only name, email, and area of interest. It does not collect health details, payment data, or a waiver until legal copy is reviewed. The purpose of the site is to help people learn beginner and advanced techniques from the videos and request private sessions. The company name, Bulletproof Personal Training, should stay visible and readable on every page.

Content Inventory

ID	Content item	Purpose	Format	Source/owner	Status	Risk or note

| C | | | Text / image / table / form / SVG / media / link | | Ready / missing / duplicate / outdated / risky / optional

| C1 | Trainer Bio in About and credentials | Show who the trainer is and why they are qualified | Text | Trainer | Missing | Keep credentials current and accurate

| C2 | For beginners and advanced lifts | Help visitors find coaching that matches their skill level | Text | Trainer | Missing | Make beginner vs advanced labels clear

| C3 | Session Types | Explain what kinds of sessions are offered | Text / table | Trainer | Missing | Align names with the Services page

| C4 | Pricing for video vs in-person | Show the cost difference between video and in-person sessions | Text / table | Trainer | Missing | No payment checkout; publish rates only after they are decided

| C5 | Tutorials | Let visitors watch training tutorials | Media / link | Trainer | Missing | Video hosting still needs a decision

| C6 | Video Files and Explanations | Teach technique with video plus short explanations | Media / text | Trainer | Risky | Copyright and hosting; some tutorials stay locked

| C7 | Training Images | Support the brand and show training in action | Image | Trainer | Risky | Confirm ownership, licensing, and alt text

| C8 | How to book | Tell visitors how to request a session | Text / link | Trainer | Missing | Calendly, Google Meet, or request form still needs a decision

| C9 | Booking Form | Collect a session request | Form | Trainer | Missing | Stay within HTML/CSS; no live payment or account login

| C10 | Traveling In-Home personal training or Online | Explain in-home vs online coaching options | Text | Trainer | Missing | Match this to Session Types and pricing

| C11 | Waiver | Get consent before training | Text / form / link | Trainer | Risky | Legal text must be reviewed before use

| C12 | Testimonials | Build trust with client feedback | Text | Trainer / clients | Optional | Use only with permission

Site Map and Page Requirements

The site is four pages with a shared top-level navigation: Home, Media, Services, and About.

- Home. Introduce Bulletproof Personal Training, show the highlight video or poster, and get people into the rest of the site. Key content: company name, highlight video, and navigation.
- Media. Let visitors watch free tutorials and see which advanced videos are locked. Key content: beginner and advanced tutorial labels that match the headings on the page.
- Services. Explain session types, show video versus in-person prices, and point people to the request form. Key content: session list, prices, and the booking path. This page does not include a live calendar or payment fields.
- About. Present the trainer's background and intro video. Key content: bio, credentials, intro video or fallback, and links to other platforms.

Page relationships stay flat. Every nav link must open the correct file. Home is the entry point; Media supports watching; Services supports requesting a session; About supports trust.

Wireframe

AI disclosure - The built-in AI on Figma generated the wireframe

[Figma Wireframe](#)

Responsive Wireframes

- Narrow (~375px). The Home nav stays on screen. There is no sideways scroll. Media, Services, and About remain visible so a phone visitor can move between pages. Session types and prices stack into a single readable column. The form fields stack full width with visible labels.
- Medium (~768px). Services content still stacks instead of overlapping. The session list and prices can be read without zoom. Navigation can sit in a tighter horizontal row if it fits; otherwise it continues to wrap cleanly. Video and supporting text sit in a vertical stack.
- Wide. The same components gain space rather than new features. Navigation stays horizontal. The highlight or intro video can sit beside short supporting copy. Pricing tables may sit side by side if they remain readable and do not force horizontal scroll.

Repeated components across all widths: site name, primary navigation, page heading, and footer or secondary links if used.

Behavior Annotations

- Navigation repeats on every page in the same order: Home, Media, Services, About. A broken link is a release failure.
- The request form includes only name, email, and area of interest. Each field has a visible <label> with matching for and id. Keyboard focus order follows the visual order, and each control shows a visible focus outline.
- Home and About use a YouTube embed instead of a local video file so the company name and navigation appear without waiting on a large download. If the video cannot play, the area still shows a poster image with alt text and a short text summary of the trainer intro.
- Media distinguishes free tutorials from locked tutorials in the copy. CSS should not fake an unlock.
- Services tables collapse into stacked rows at tablet and phone widths. Each price stays attached to the session it belongs to.
- Images need confirmed ownership and alt text before launch. Missing license or missing alt text is a content risk, not a decoration detail.
- There is no login state, paid state, or dynamic calendar state. The only special states to plan for are missing media, a video that will not play, and a static form that cannot process payments

Acceptance Criteria

Responsive:

When the browser is about 375px wide, the Home nav must stay on screen with no sideways scroll and still show Media, Services, and About so a phone visitor can move between pages. I will test this by shrinking the window or using DevTools at 375px and checking that nothing is cut off.

Responsive:

When the viewport is about 768px wide, the Services session types and video vs in-person prices must stack into a readable column instead of overlapping so a visitor can compare coaching options. I will test this by setting DevTools to a tablet width and reading the session list and prices with no zoom and no side scroll.

Accessibility:

When a visitor uses only the keyboard, every control in the session-request form (name, email, area of interest) must get a visible focus outline in a logical order, and each field must be tied to a `<label>` with matching `for` and `id` so they can request a session without a mouse. I will test this by tabbing through the form and checking each input's label in the inspector.

Accessibility:

When a visitor opens About or Home, the page must use one `<h1>` for the page title (trainer or company name), then `<h2>` / `<h3>` in order, with main content in `<main>` and site links in `<nav>`, so a screen reader can reach the trainer bio and tutorials. I will test this by checking the heading outline and landmarks in the Accessibility pane or a headings bookmarklet.

Browser support or fallback:

When the highlight or intro video cannot play, the Home (and About) video area must still show a poster image with alt text plus a short text summary of the trainer intro so visitors can still learn who the trainer is. I will test this by opening the page in a second browser and by temporarily renaming the video file to confirm the image and text stay.

Performance:

When Home (and About) load the highlight or intro video, the page must use a YouTube embed instead of a local video file so the company name and navigation show without waiting on that download. I will test this by checking the page source for a YouTube embed to confirm the site is not serving the video file itself.

Metadata or discoverability:

When a visitor looks at a browser tab or page source, each of Home, Media, Services, and About must have a unique `<title>` that includes “Bulletproof Personal Training” and what that page is for, plus a short `<meta name="description">` so the pages can be told apart in search and bookmarks. I will test this by reading the tab title on every page and viewing source for the title and description tags.

Release quality:

When the site is ready to share, every nav link must open the correct page (no missing files), beginner vs advanced tutorial labels on Media must match the headings on the page, and the request form must include only name, email, and area of interest (no health or payment fields) so a visitor can browse tutorials and ask for a session. I will test this by clicking every navigation link, comparing labels to headings, and checking the form fields in the browser.
